Excerpt: . . . of the fermentation they induce in attacking the tissues of the host, in which capacity they are organic ferments. Some of the pathogenic forms attack but a single host, others (as *Bacterium tuberculosis*) can utilize a wide range of hosts. The chromogenic forms are readily recognized by the coloring matters they produce. The zymogenic forms are those which produce inorganic ferments (enzymes), which induce fermentation without themselves being changed. Upon the basis of oxygen supply, bacteria may be either aerobic or anaerobic, dependent upon their need of free oxygen or not. Certain bacteria can live without a supply of free oxygen if living in a solution in which they can produce fermentation; but if such is not the case, free oxygen must be available. Hence there are facultative and obligate aerobic and anaerobic forms; many of the pathogenic forms being facultative anaerobic forms. Notable...
